Interview Finalist Case: *The Table*

Early Talent Program · STRETCH, FDE and Graduate Rotational · Winter 2027

Welcome

Congratulations on getting this far! This is the part of our interview process where we throw something at you to see how you think, problem-solve, deliver and communicate.

The prompt

Make something useful. Use at least two of the things on *The Table*

That's it. There's no hidden right answer, no problem we're waiting for you to find, and no format you have to use.

Build a tool, write a plan, design a screen, run an analysis, pitch a product or feature, make a video. Whatever you think is the most useful thing you can make in the time you have.

Two rules:

✓ **Useful means it has a clear *"so what."*** Who is it useful to, and what changes for them because it exists? Impressive is welcome too, but impressive without a "so what" isn't enough.

✓ **"Use at least two things" means they carry weight.** If we took one of your objects away, your thing should stop working. Mentioning an object for context doesn't count.

> → Using more objects doesn't score higher. Two objects used well beat six mentioned.

DON'T PANIC! Or… why this case looks like this

The idea for this case comes from the format of an art competition: The organizers put a handful of objects on a table and said: use at least two of these to make something. Ours works the same way, with one difference: what you make has to be *useful*.

Most case studies hand you a problem and grade how close you get to the answer. Real work outside of school rarely comes like that. Instead, you might notice something, work out why it's happening, decide it's worth solving, and go find what you need to make it happen.

So instead of a problem, we're giving you some real (or synthetic but realistic) pieces of how GeoComply works, from transcripts and data to the products and the people.

The interns who do best here are the ones who find something worth building before anyone asks. This is your first chance to show us what you'd find.

What's on *The Table*

They're in no particular order, so start wherever you're curious. Not sure where to start? The Story So Far is the shortest way into how GeoComply works.

Object	Source	What it is
The Story So Far	Public sources	How GeoComply got here
Product Landscape Orientation	Real, with some details changed	What GeoComply makes, how it fits together, and who else customers can choose
Pig-butchering white paper	Public	GeoComply's 2024 research on a kind of online scam
Match Ready	Public	A GeoComply blog post on preparing for major sporting events
Quarterly business review transcript	Synthetic	A meeting transcript: account teams reporting back on four customers
Technical support shadowing transcript	Synthetic	A meeting transcript: a support specialist walks new interns through the job
Signal Explorer package (HTML, CSV, MD)	Synthetic	A working, but (highly simplified) sandbox of one of GeoComply's fraud investigation tools, with a week of location checks in it. Download the HTML file and open it in a web browser; it needs an internet connection for the network view. The CSV files are the data behind it, and the MD file explains them.
IDComply Data	Synthetic	Six months of identity verification results and support tickets for eight customers
Vertical pipeline extract	Synthetic	A sales report of opportunities outside gaming
About the Intern Program	Real, with some details changed	How the internship works and how interns are evaluated

Optional: you can book 30 minutes with one of our current interns to show them your work and ask clarifying questions before your presentation. Their project areas, to help you choose who to talk to:

- Software Engineering
- Financial Automation
- IDComply Product Operations

- Talent Acquisition
- TechOps
- AI Integrations
- Marketing Automation

> → A note: We've run this case through different LLMs ourselves, so we know what it finds. Show us what it missed, or what it couldn't have added without human direction or intervention.

Presenting your work

We'll set up a 50-minute interview. You'll present what you made in 15 minutes or less to a panel from the Early Talent team and the teams you might join, then talk it through with us. Expect the first question to be "so what?"

After that, we'll want to know:

? **Who it's for,** and what changes for them

? **Why you picked these objects,** and what you left out on purpose

? **Whether it works,** and how you know

? **What you'd do next** with another week

> → A rough thing that works beats a beautiful thing that doesn't.

A few practical notes

✓ **Time.** This challenge is designed to be an afternoon or two of focused work, not a lost weekend.

✓ **Presentation.** 15 minutes to present and demo, followed by 30 minutes of Q&A and conversation with the hiring panel. Bring whatever you need to show it: slides, a live demo, a file, a screen share.

✓ **Sending it in.** Email what you made to [contact] by 9 am on the day of your presentation. If a file's too big, a link is fine. If you'd like a quick practice run beforehand, just ask. If you want to edit your slides on the way to the office, I salute you.

✓ **AI tools.** Use them. Show us where they paid off, where they were wrong and needed direction, and where your own judgment did better.

✓ **Tools we use.** Google Workspace, SQL, Python, Databricks, spreadsheets, Claude Code, Apps Script and GCP. Use any of these, or anything else you'd reach for.

✓ **Don't spend your own money.** If your school doesn't give you free access to AI or vibe coding tools, reach out to Eleanor and we'll set you up with a plan GeoComply pays for.

✓ **Outside research.** Welcome. Tell us where it came from.

✓ **Keep it to yourself.** Please don't share these materials or post them anywhere. We'd like to keep using the good ones for future candidates.

✓ **Questions.** Email [contact].

Next steps

Have fun with it. We're looking forward to seeing what you build.
